FOREWORD

On September 1, 1965 the Texas Water Commission (formerly, before February 1962, the State Board of Water Engineers) experienced a far-reaching realignment of functions and personnel, directed toward the increased emphasis needed for planning and developing Texas' water resources and for administering water rights.

Realigned and concentrated in the Texas Water Development Board were the investigative, planning, development, research, financing, and supporting functions, including the reports review and publication functions. The name Texas Water Commission was changed to Texas Water Rights Commission, and responsibility for functions relating to water-rights administration was vested therein.

For the reader's convenience, references in this report have been altered, where necessary, to reflect the current (post September 1, 1965) assignment of responsibility for the function mentioned. In other words credit for a function performed by the Texas Water Commission before the September 1, 1965 realignment generally will be given in this report either to the Water Development Board or to the Water Rights Commission, depending on which agency now has responsibility for that function.

Texas Water Development Board

WATER - LEVEL DATA FROM
OBSERVATION WELLS IN THE
SOUTHERN HIGH PLAINS OF TEXAS

INTRODUCTION

This report has been prepared to present water-level records to interested individuals and to maintain a current published record of the water-level data collected by the Texas Water Development Board. Water-level records from 29 counties in the Southern High Plains of Texas are presented in this report. The area of these counties totals 28,316 square miles. The water-level data are from current and historical observation wells located principally in areas of large withdrawals of ground water for irrigation and public use. Water-level records and related information are presented in county tabulations, location maps, and hydrographs of water levels in representative wells. Wells from which the water-level data were obtained are part of the statewide network of observation wells maintained by personnel of the Texas Water Development Board.

Evaluation of water-level records is an integral part of every ground-water investigation. Water-level records of an aquifer reflect the amount of water in storage and changes in storage as well as direction and rate of water movement. Consequently, compilation of water-level data from selected wells on a long-term basis is essential. Excessive decline of water levels is a principal cause of increased pumping cost, decreased well yields, abandonment of shallower wells, and in some areas an undesirable change in water quality due to salt-water encroachment.

WATER-LEVEL OBSERVATION PROGRAM

Observation wells are measured by the Texas Water Development Board in various areas of the State for the purpose of observing changes in water levels in the principal aquifers. The Board's Water-Level Observation Program is directed toward the accomplishment of several objectives. These objectives are: (1) the selection, in every major aquifer, of a network of wells that are spaced to afford adequate data for preparation of piezometric maps or water-table contour maps referenced to sea-level datum; (2) annual or periodic measurement of water levels in each well in this network made at the time of year when water levels have recovered from the effect of pumping during the season of peak water demand; (3) the operation of continuous water-stage recorders in representative wells where a continuous record of water-level changes is needed; (4) preparation of maps and graphs that show the fluctuation of water levels as revealed by water-level measurement, and (5) publication of water-level information and the evaluation of the data.

Map of Texas Showing Area Covered by This Report
Texas Water Development Board

Prior to September 1960, the Water-Level Observation Program for Texas was maintained by the U.S. Geological Survey in cooperation with the Texas Water Development Board. After that date direction of most of this program was assumed by the Board. The Water-Level Observation Program of the Texas Water Development Board is conducted by personnel of the Ground Water Division, a Board Technical Service Division, under the general direction of John J. Vandertulip, Chief Engineer, and R. C. Peckham, Director of the Ground Water Division. This report was prepared under the supervision of Bernard B. Baker, Coordinator, Ground Water Availability Program, and Robert L. Bluntzer, Head, Water Level Section. Tabulations of water-level data contained in this report were prepared by the Board's Electronic Data Processing Division under the general supervision of Ivan M. Stout, Director.

The following personnel of the Texas Water Development Board have participated in the collection of data in the Southern High Plains since 1960:

Curtis Andrews	Sam Gammon
Robert L. Bluntzer	Glen Gilmore
Allan Cunningham	Robert McCullough
Hershel D. Davidson	Dan A. Muller
Joe Dillard	W. Ralph Muse
Don Draper	Frank Rayner
Charles E. Ferguson	John Staves

The highly cooperative work of the personnel of the Southern High Plains Underground Water Conservation District No. 1, and the Panhandle Ground Water Conservation District No. 3, who measured water levels and recorded the data for many of the wells listed in this report, is gratefully acknowledged. Appreciation is expressed to the many landowners for their interest and cooperation in allowing their wells to be used in the Board's Water-Level Observation Program.

METHODS OF COLLECTING WATER-LEVEL DATA

Water levels in most of the observation wells are measured on an annual basis. If possible, wells selected for annual observation purposes should not be equipped with a pump and should be located a reasonable distance from heavily pumped wells. However, in areas of intense ground-water development usually the only wells available for measurements are equipped with large-capacity turbine pumps. It is necessary to measure the water levels in these wells after allowing sufficient time following cessation of pumping for water levels to recover to a level representative of the general area. In irrigated areas it is most desirable to measure water levels during the winter months when pumping is at a minimum or nonexistent and water levels have recovered to their highest level.

Water levels are reported as depth to water below land surface. This depth is obtained by measuring the distance from a permanent measuring point near the land surface to the water level in the well, and then subtracting the vertical distance between the measuring point and the land surface. Water-level measurements are obtained by one of the following methods:

(1) Wetted Steel Tape Method

A calibrated steel tape is lowered into the well until a portion of the lower end of the tape is submerged in the water. The depth to water below the well's measuring point is obtained by subtracting the wetted portion at the lower end from the footmark held at the well's measuring point.

Water levels measured with a steel tape are recorded in the Texas Water Development Board's records to the nearest hundredth of a foot. The wetted steel tape method for obtaining water-level measurements is considered the most accurate, and is the method commonly used by Texas Water Development Board personnel.

(2) Electric-Line Method

The electric line measuring device consists of a hand operated reel, a current meter, a dry cell battery for power, and a length of double-conductor insulated wire with an electrode at the end. The electric line operates on the principle of a completed electric circuit; when the electrode on the end of the electric line contacts the water surface in the well, the electric circuit is completed and is indicated on the current meter at land surface. Calibrated markings on the electric line provide a means for direct reading of the water level. The electric-line method is used where water-level measurements are unobtainable with a steel tape, such as in wells having leaky casing.

Water-level measurements obtained by this method are recorded in the Texas Water Development Board's records to the nearest tenth of a foot.

(3) Air-Line Method

An air line is a metal tube attached to the outside of the pump column and extending from the pump base to some precisely known depth that is below the lowest water level to be measured. The air line is equipped with a pressure gage and an ordinary tire valve, which are attached to some convenient place on the pump. The pressure required to force all of the water out of the air line is equal to the pressure exerted by the column of water standing outside the air line. Some air-line gages read directly in feet of water, and some are equipped with gages that read in pounds per square inch and must be converted to feet of water by multiplying the gage reading by 2.31. In both instances the resulting figure must be subtracted from the known vertical air-line length to determine the depth to water from the center of the gage. Air lines are most commonly installed on industrial and municipal wells that have large-capacity turbine pumps.

Water-level measurements obtained by the air-line method are recorded to the nearest foot in the Texas Water Development Board's records. The advantage of the air line is that water levels can be measured conveniently in wells that will not admit other measuring devices. Water levels can be measured safely by air line while the well is pumping, and can be measured in sealed wells which assure the owner that no contamination will take place by foreign material falling into the well. The disadvantage of the air-line method is that measurements are accurate only to the nearest foot; the method cannot be used reliably where more precise measurements are required.

(4) Automatic Recorder Method

An automatic water-level recorder consists of a float suspended by a metal tape or cable from a recording instrument installed over the well. As

the float rises and falls with the water surface in the well, the motion is transferred to a pen which graphs the fluctuation on a clock-driven chart. The continuous recording of water levels in a well affords the best means for observing rapid and irregular water-level fluctuations in areas of large ground-water development.

Recorders are visited at frequent intervals for purposes of maintenance, accuracy checks, and collecting the water-level records. Water-level readings taken from the recorder charts are generally tabulated in the Texas Water Development Board's records to the nearest hundredth of a foot.

(5) Flowing Wells

When measuring water levels in flowing wells (water level above land surface), it is necessary that the well be shut-in so that the static pressure can be observed at some convenient measuring point near the ground. The static pressure is then converted to feet to give the water level above land surface. Flowing wells can be measured with a pressure gauge, a mercury U-tube manometer, or a water manometer.

The accuracy in determining the shut-in pressure of flowing wells is considerably less than the accuracy obtained when measuring water levels below land surface. Most pressure gauges cannot be read more accurately than to the nearest foot. Furthermore, unless the well is shut-in for a sufficient period of time, the measured pressure will be somewhat less than the true static pressure. Pressure measurements are recorded in the Texas Water Development Board's records to the nearest foot.

PRESENTATION OF DATA

For each observation well in the Texas Water Development Board's Water-Level Observation Program, the water-level measurement, date of measurement, pertinent remarks, and initials of the person taking the measurement are recorded in the field on standard forms. The field data are later transferred to punch cards which enable the water-level measurements to be statistically analyzed and the results printed in a concise tabular form by the use of computers and other data processors.

Tabulated in this report are records of water levels from observation wells for 29 counties of the Southern High Plains. These listings provide the following information: well number, depth of well, elevation of land surface in feet above mean sea level, dates of measurement, measurements of water level in feet below land surface, and changes (decline or rise) in water level from the previous year's measurement. These tables are reproduced from direct print-outs of electronic data processing equipment.

Preceding the table for each county is a well-location map. A well symbol and the last three digits of the well number appear on the map at the location of each well listed in the county tabulation.

Hydrographs, showing changes in water level, are presented for selected representative wells following the respective county tabulations. The wells for which hydrographs have been prepared are indicated on the maps by a line beneath the well number.

This report includes the water-level records published previously in Texas Water Commission Bulletin 6207, which is now out of print. In addition to the records through 1962 contained in Bulletin 6207, this report contains more recent water-level measurements, records for other wells that have been added to the Board's Water-Level Observation Program in the Southern High Plains since 1962, and the records for observation wells in four additional counties. Some well numbers have been adjusted since the publication of Bulletin 6207. These number changes are given in this report on the first page of the table for each county.

WELL-NUMBERING SYSTEM

To facilitate the location of wells and to avoid duplication of well numbers in present and future studies, the Texas Water Development Board has adopted a statewide well-numbering system. This system is based on division of the State into grids formed by degrees of latitude and longitude and the repeated division of these grids into smaller ones, as shown in the following diagrams.

The largest grid, a 1-degree grid, is divided into sixty-four $7\frac{1}{2}$ -minute grids, each of which is further divided into nine $2\frac{1}{2}$ -minute grids. Each 1-degree grid in the State has been assigned an identification number. The sixty-four $7\frac{1}{2}$ -minute grids are numbered consecutively from left to right, beginning in the upper left-hand corner of the 1-degree grid, and the nine $2\frac{1}{2}$ -minute grids within the $7\frac{1}{2}$ -minute grids are similarly numbered. The first 2 digits of a well number identify the 1-degree grid; the 3rd and 4th, the $7\frac{1}{2}$ -minute grid; the 5th digit identifies the $2\frac{1}{2}$ -minute grid; and the last 2 digits identify the well within the $2\frac{1}{2}$ -minute grid.

FLUCTUATIONS OF WATER LEVELS

Changes in water levels are due to many causes. Some are of regional significance whereas others are local. The principal causes of water-level fluctuations are changes in recharge and discharge and reflect changes in the volume of water stored in an aquifer. When discharge exceeds recharge some of the water discharged from the aquifer must be withdrawn from storage, and water levels decline.

When a water well is pumped, the water table (the piezometric surface in artesian aquifers) in the vicinity of the well is drawn down in the shape of an inverted cone with its apex at the pumped well. This cone is commonly referred to as the cone of depression. The development or growth of this cone depends on the physical and hydraulic characteristics of the aquifer, and on the rate of pumping. In areas where recharge is less than the amount of water pumped from wells, water is removed from storage in the aquifer to supply the deficiency, and water levels will continue to decline.

Where extensive development takes place in an aquifer, each well superimposes its individual cone of depression on the cones of neighboring wells. This results in the development of a regional cone of depression. When the cone of one well overlaps the cone of another, interference occurs and an additional lowering of water levels takes place as the wells compete for more water.

Location of Well 57-15-701

- 57 1-degree quadrangle
- 15 7 1/2 minute quadrangle
- 7 2 1/2 minute quadrangle
- 01 Well number within 2 1/2 minute quadrangle

Well-Numbering System

Texas Water Development Board

The amount or extent of interference between these cones of depression depends on the rate of pumping from each well, the spacing between wells, and the hydraulic characteristics of the aquifer.

Hydrographs of Selected Wells in Cochran County and Precipitation at Morton

Texas Water Development Board

WATER-LEVEL MEASUREMENTS IN CROSBY COUNTY, TEXAS

CROSBY COUNTY

WELL NUMBER CHANGE SINCE 1962
NUMBER IN BULLETIN 6207 NUMBER IN THIS REPORT

23-12-903

23-12-903 & 23-12-904

WATER-LEVEL MEASUREMENTS, IN FEET, BELOW LAND SURFACE
* DENOTES WELL PUMPED RECENTLY OR NEARBY WELL PUMPING

Hydrograph of Selected Well in Lynn County and Precipitation at Slaton

Texas Water Development Board

WATER-LEVEL MEASUREMENTS IN MARTIN COUNTY, TEXAS

Location of Observation Wells in Martin County

Texas Water Development Board

BASE MAP FROM TEXAS STATE HIGHWAY DEPARTMENT

MARTIN COUNTY

WELL NUMBER CHANGE SINCE 1962

NONE

WATER-LEVEL MEASUREMENTS, IN FEET, BELOW LAND SURFACE
 * DENOTES WELL PUMPED RECENTLY OR NEARBY WELL PUMPING
